Zamboanga City, Philippines (Open to remote)

## Summary

Backend engineer with 3+ years building and maintaining production systems in **PHP** and **Laravel**, from hospital and university platforms to a live forex trading system. I own the hard parts: legacy-to-Laravel migrations, REST APIs, and Redis-backed internal tooling, and ship them without regressions. Comfortable across the stack with React and TypeScript, and fluent in Python for microservices. I treat AI tooling as core to delivery, building reusable Claude skills, agents, and automated tests that speed up each sprint.

## Technical Skills

### Backend

- **PHP**, **Laravel**, Filament, REST API design, Eloquent ORM
- **Python**, FastAPI, microservices, third-party API integration
- Legacy migration & system modernization (CodeIgniter → Laravel)
- Internal developer platforms, feature flags, workflow automation

### Databases & Caching

- **MySQL**, PostgreSQL, Eloquent ORM, raw SQL, schema design
- **Redis** write-through caching, query optimization, performance tuning
- Database migrations, reporting & analytics queries

### Frontend

- **React**, **TypeScript**, Inertia.js, JavaScript
- Tailwind CSS, ShadCN UI, Bootstrap, responsive design

### AI & LLM Integration

- **Claude API**, agentic AI workflows, LLM application integration
- Reusable skills & agents, automated testing, OpenAI & Gemini APIs

### DevOps & Tools

- **Git**, BitBucket, **Docker**, AWS, CI/CD pipelines
- Jira / Atlassian, Postman, Vercel, Laravel Cloud

## Experience

### Backend Engineering, Legacy Migration & AI-Augmented Delivery

Jul 2025 – Present

Software Developer, Titan FX

- Sole developer lead migrating the trader ID-verification module from legacy PHP CodeIgniter to Laravel in three months, preserving heavy onboarding business rules through a maintained production launch.
- Led development of an in-house feature-flag platform on Laravel and Filament, using write-through Redis so flag changes propagate instantly to all consuming systems, replacing a slow third-party service.
- Build and maintain the backend REST APIs behind a live forex/CFD trading platform, shipping new features and resolving production issues across a high-availability, latency-sensitive system.
- Drove adoption of an agentic AI workflow with Claude across the engineering team, building reusable skills, agents, and automated tests that shortened delivery cycles and cut rework per sprint.

### Backend APIs, Integrations & Database Performance

Jun 2024 – Jun 2025

Backend Developer (Computer Programmer I–II), Zamboanga City Medical Center

- Led PNP/PSA digital-signature integration for a government hospital, building the Laravel backend APIs and a Python FastAPI microservice for secure, standards-compliant electronic signatures.
- Optimized the DTR and leave-report modules with Eloquent query caching and targeted query rewrites, cutting report load times on a growing HR dataset without a schema rewrite or added infrastructure.
- Developed Laravel REST APIs for a hospital Purchase Request Monitoring System that digitized a paper-based procurement process and streamlined a multi-step, multi-department approval workflow end to end.
- Brought AI coding tools such as Windsurf and Codex into daily development, and built small automations and reusable prompt workflows that sped up feature delivery across multiple hospital systems.

- Designed and deployed a full-stack procurement system in PHP, MySQL, and Ajax/jQuery that replaced a manual, paper-based process and gave staff a single, tracked, end-to-end approval workflow.
- Maintained a legacy PHP and MySQL university portal and built its DTR reporting module on raw SQL queries, working directly against existing production schemas without a full rewrite or downtime.

**Selected Projects**

---

**CentroSys: Pharmacy Sales & Inventory Platform** [centrosys.online](https://centrosys.online)

- Built a full-stack inventory and sales platform with a React and TypeScript frontend and a Laravel REST API on MySQL, giving the pharmacy real-time stock tracking in place of manual records.

**TitanSys: Auto-Parts Inventory System** [titansys.laravel.cloud](https://titansys.laravel.cloud)

- Designed and developed a Laravel 12 inventory system with Inertia.js and React, added real-time dashboards for stock levels and sales performance, and deployed it on Laravel Cloud for a car-parts business.

**Premiere Telekkom: Telecom API Portal** [pt.zambo.tech](https://pt.zambo.tech)

- Co-led an API-driven portal that integrated the DITO telecom API for load transactions and reloader-company registration, built with PHP, MySQL, Bootstrap, and Ajax/jQuery for asynchronous API calls.

**Education**

---

Bachelor of Science in Computer Science 2018 – 2023  
Ateneo de Zamboanga University, Zamboanga City, Philippines
